

HOW DOES BODY TAKE UP OXYGEN?

	$K_D$	# SITES	$\sim \Delta\theta$
MYOGLOBIN	2.6	1	-0.1
HYPOTHETICAL	44	1	-0.4
HEMOGLOBIN	26	4	-0.75
HEMOGLOBIN + BPG	>26	4	-0.95

$$\Delta\theta = \theta_2 - \theta_1$$

$$\Delta\theta = \frac{1}{1+K_D/L_2} - \frac{1}{1+K_D/L_1}$$

$$= \frac{1}{1+K_D/25} - \frac{1}{1+K_D/100}$$

SHOW HEME (Fe(II) is  $\Delta^7$ ; INDUCED DIPOLE)

SHOW GOODSELL

START WITH STRUCTURE OF Mb (PDB 1A2M)

THINGS TO NOTE:

- $\alpha$  HELICAL STRUCTURE
- HEME BINDS  $O_2$
- FIRST STRUCTURE SPERM WHALE

1840s, SCHWIBER  
CHEMICAL  
CRYSTAL

$$\Delta\theta \sim 10\%$$

OKAY. LETS LOWER AFFINITY A BIT.

$$\text{BEST } K_D = 45 \text{ TORR}$$

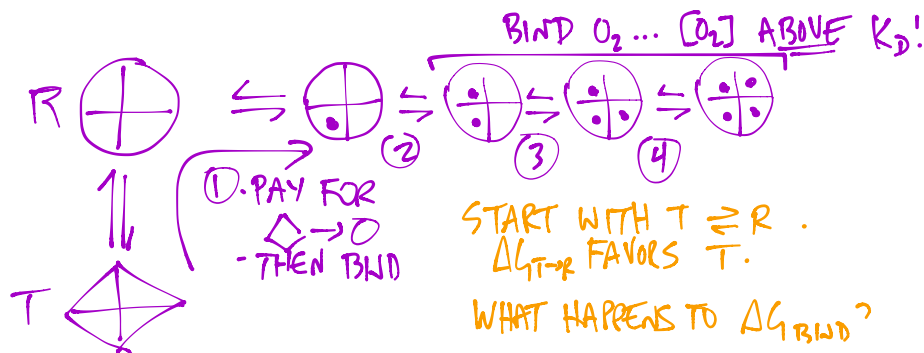

$$\Delta\theta = 0.38$$

HOW CAN WE IMPROVE  $\Delta\theta$ ? MAKE CURVE STEEPER.

HOW DO YOU DO THIS?

$\Rightarrow$  MULTIPLE BINDING SITES

$\Rightarrow$  COUPLE THEM TOGETHER

SHOW ORAGAMI.

$\Delta G_{BIND}$

$$\Delta G_{\text{LOAD}}^{(1)} = \Delta G_{T \rightarrow R} + \left[ \Delta G^{0'} + RT \ln \left( \frac{[\text{Hb} \cdot \text{O}_2]}{[\text{Hb}][\text{O}_2]} \right) \right] \leftarrow \text{AS } \text{O}_2 \text{ T, GETS MORE NEGATIVE.}$$

DEPENDS.

EVENTUALLY  $\Delta G_{\text{BIND}}$  WILL BE MORE NEGATIVE THAN  $\Delta G_{\text{TR}}$  AND SYSTEM WILL LOAD.

$$\Delta G_{\text{LOAD}}^{(2)} = \cancel{\Delta G_{T \rightarrow R}} + \Delta G^{0'} + RT \ln \left( \frac{[\text{Hb} \cdot \text{O}_2]}{[\text{Hb}][\text{O}_2]} \right) \leftarrow \text{LOADS IMMEDIATELY!}$$

PREPAID

CAN BE DESCRIBED W/ HILL EQN:

$$\theta_{\text{HILL}} = \frac{L^n}{L^n + K^n} \quad \leftarrow \begin{array}{l} \text{STEERNESS (OFTEN} \\ \text{\# SITES)} \end{array}$$

MOST IMPORTANT FACT ABOUT Hb VS Mb BINDING CURVE?  
- STEEPER. BETTER LOADING AND UNLOADING

WHY DOES CURVE GET STEEPER?

- HARDER TO LOAD INITIALLY (TAKES HIGHER  $[\text{O}_2]$  TO BIND BECAUSE HAS TO PAY FOR  $T \rightarrow R$  TRANSITION), BUT AFTER THIS IS PAID Hb IS ABOVE  $K_D$  AND COMPLETELY LOADS.

HOW DOES BPG BINDING ALTER  $\text{O}_2$  LOADING AND UNLOADING?

- BPG BINDS TO T, STABILIZING IT AND CAUSING  $\text{O}_2$  AFFINITY TO GO DOWN.

$Hb + Hb_{L4}$  W LOADS BETTER BECAUSE T STATE STABILIZED. LESS  $O_2$  AFFINITY
